

Fuel Savings Tips

1. When possible, reduce vehicle idle time when parked.
2. Only use A/C when outside temperature is over 90 Fahrenheit.
3. **State Owned Fueling Facilities are typically less than commercial sites, especially when commercial prices are climbing. When shopping at commercial sites, remember that fuel prices vary substantially so always shop for the best price.**
4. Think Alternative Fuel first, if equipped. Example: Compressed Natural Gas (CNG) is usually less than traditional fuels.
5. Use the correct fuel for the vehicle prescribed in the owner's manual by the manufacturer. (i.e. regular vs. premium) Most vehicles in the Utah area only require regular gasoline due to the altitude.
6. Avoid over acceleration of the engine or avoid fast start and stop situations.
7. Use vehicle cruise control where possible.
8. Drive the posted speed limit or below.
9. Reassess the type vehicle you are using. (IE. Do you need an SUV or will a sedan be more efficient).
10. Car pool to meetings instead of using separate vehicles. Consider trip reduction alternatives, like telecommuting, flexible scheduling, web meetings, teleconferencing, etc.
